Book reviewed: Stephen P. Dunn. *The Economics of John Kenneth Galbraith: Introduction, Persuasion and Rehabilitation*. (Cambridge, New York, Melbourne, Madrid, Cape Town, Singapore, Sao Paulo, Delhi, Dubai, Tokyo, Mexico City: Cambridge University Press, 2010), pp. xx, 477, US\$115.00, ISBN 978-0521-51876-5.

Review:

Stephen Dunn describes this book as having its main goal to show that John Kenneth Galbraith's (JKG's) thought has been under-appreciated by both Post-Keynesians and Institutionalists in the history of economic thought. But in reality the book is really of two parts, the first is Dunn's very detailed and engaging description of JKG's thought *without* tying-in in any systematic way followers or precursors, the second is to relate JKG's influence on those that followed him, especially in Post-Keynesian Economics. It is only under this first part that the book fully succeeds, more on this to follow.

Dunn divides JKG's thought into to two main currents, the first is his "major trilogy" (p. 295) of the corporatization of the American economy. This trilogy being *The Affluent Society* (1958), *The New Industrial State* (1967) and *Economics and the Public Purpose* (1973). It is in these volumes that JKG proposes his theories of the "bimodal" economy where the large corporations

1
2
3 (one-half of the economy) hold smaller businesses, the other half of the economy, in a
4
5 “subservient” (p. 354) position due to the social power created by the “technostructure” in the
6
7 large corporations. This current also includes JKG’s well-known “social imbalance” narrative
8
9 where society spends too much on personal consumption while there is the “under production of
10
11 merit and public goods” (p. 89). It is the corporate technostructure which has harnessed the
12
13 awesome technological powers of modern capitalism to produce “socially irrelevant
14
15 commodities” (p. 89) while, unfortunately, power over this technology is not in the hands of
16
17 those who provide public goods (Galbraith’s main concerns were environmental degradation,
18
19 militarization, lack of public housing, healthcare and transportation, and, an education system
20
21 focused too much on economic production).
22
23
24
25
26

27
28 The second thesis, where Dunn attempts to show how JKG’s thought has been influential on
29
30 subsequent Post-Keynesians, plays less of a role in the book and in fact only is discussed in
31
32 detail not until the last quarter of the book. The major works in this narrative are *The Great*
33
34 *Crash, 1929* (1955), *Money* (1975) and *A Short History of Financial Euphoria* (1990). It is here
35
36 that we are introduced to the Post-Keynesian tropes of endogenous (and non-neutral) money, the
37
38 wage-price spiral, imperfect competition and excess capacity (only of course in the dominant
39
40 large corporations), the failure of Say’s Law in bringing adequate employment without
41
42 government fiscal policy demand management, and, the fallacy of composition where debt at the
43
44 macro (State) level cannot be compared to that of the household if that public debt is used to
45
46 ensure adequate levels of employment, especially for public works during periods of recession
47
48 and depression.
49
50
51
52
53

54
55 The two currents of the book then are held together under the “bimodal” theory. As one example
56
57 we find that retained earnings reduce risk faced by the large corporations from the endogenous
58
59
60

1
2
3 money instabilities created by a monopolized-centralized monetary authority, whereas
4
5 manipulation of the interest rate can influence economic activity in the “market” (smaller
6
7 businesses) as opposed to the “planning system” (the dominant large corporations).
8
9

10
11 Where the book might have been improved in Dunn’s attempt to place JKG in the historical
12
13 lineage of Post- Keynesian economic thought is in the chapter called “Money and the real
14
15 world”. It is here that Dunn describes JKG’s ideas relating to today’s current Post-Keynesian
16
17 tropes as espoused by, for example, Victoria Chick, Paul Davidson, Paul Krugman, Hyman P.
18
19 Minsky, Malcolm C. Sawyer, Paul Shiller and Dunn himself. (There is a curious lack of
20
21 reference to Robert Frank in this book, someone whose views on consumerism and normative
22
23 prescription closely follow JKG, though there are the necessary references to Veblen). Dunn
24
25 describes JKG’s ideas well, while mostly only giving relevant citations to these follow-on Post-
26
27 Keynesian thinkers. What is missing in this chapter is analysis as to how JKG’s ideas actually
28
29 influenced these following thinkers. Describing JKG’s ideas, then adding citations for further
30
31 readings does not complete the argument that Dunn states he sets out to achieve. For a
32
33 knowledgeable Post-Keynesian this approach might be sufficient but for a historian of economic
34
35 thought new to and interested in, such a popular figure as JKG, this is insufficient and perhaps
36
37 disappointing.
38
39
40
41
42
43
44

45 This being said, however, in the next chapter mostly about financial booms and busts called “A
46
47 man for our times” Dunn is much more careful and thorough while at the same time using
48
49 sparkling narrative in describing the commonalities (and some critique) amongst Post-
50
51 Keynesians on the instability of endogenous money capitalism. It appears that Dunn is more
52
53 interested in the analysis of this instability as opposed to more general Post-Keynesian economic
54
55 theory. Whether or not one agrees that “greed”, “speculation”, “hubris”, “deregulation” and the
56
57
58
59
60

1
2
3 herd-like behavior of the “animal spirits” create recession- and depression-causing business-
4
5 cycles, Dunn here has done well in presenting JKG’s influence upon Galbraithian descendants
6
7 (including Paul Krugman and Joseph Stiglitz). In this chapter we learn as well that financial
8
9 institutions deemed “too big to fail” are part of the dominant sector in JKG’s bimodal theory
10
11 (that is until/if they are allowed to go bankrupt and become liquidated).
12
13
14

15
16 Dunn spends most of the book on describing the “planning system” used by corporations to
17
18 minimize market risk, describing how these corporations have the ability, through monopolistic
19
20 power, to manipulate, in fact “victimize” (p. 63) the consumer into buying their product. The
21
22 planning system of these corporations (the tobacco, pharmaceutical, agro-business and
23
24 automobile industries are described in the most detail) give them power over the consumer to
25
26 where it is not price competition (nor consumer sovereignty) that determines supply and demand.
27
28
29

30
31 Large corporations support Keynesian demand management (government spending in times of
32
33 economic downturn) in order to keep demand high enough to produce at their capacity
34
35 (technological advance and concomitant investment leads to over-capacity), yet we find that
36
37 Galbraith admits that these fiscal stimulus policies help the dominant sector over the general
38
39 good. Large corporations, especially those in the military-industrial complex and those receiving
40
41 the necessary stimulus spending (some corporations seek “a protective response from the state”,
42
43 p. 61) have social and economic powers over the other half of the economy which is dependent
44
45 upon the market alone for survival.
46
47
48

49
50 Dunn proposes that this corporate “planning system” adds to what was missing in pre-
51
52 Galbraithian Keynesianism; a microfoundation for stability to compliment the macrofoundations
53
54 of the stability of monetary and fiscal policy. However, others may not agree with this as this
55
56
57
58
59
60

1
2
3 was perhaps accomplished by Ronald Coase in 1937, albeit of course Coase is not considered of
4 the Post-Keynesian school. Dunn places JKG's work in reference to that of Coase, but, at least
5 to this reviewer, credits JKG with too much originality viz-a-viz Coase.
6
7
8
9

10
11 In Galbraith's "Revised Sequence" where it is not the consumer who is sovereign it is the
12 dominant large corporate sector who receives the fiscal stimulus spending (and benefits of the
13 "multiplier") needed to keep producing towards capacity while not having to lower prices and
14 profits and who gain through the wealth created under capitalism and the affluent society. The
15 technostructure is not out to maximize profits for the shareholders but to create wealth, power
16 and survival for themselves.

23
24

25
26 As stated, one of the Galbraith's theses is that half the economy in the USA is dominated by
27 large corporations. Dunn presents this data in Table 1, page 114 where we find that in 2002 (the
28 book was in published prior to the 2012 census) self-employed people (those without employees)
29 make-up around 17% of the economy's workforce. This then means of course that 83% of the
30 workforce have 'jobs' and work for others. According to the table the dominant corporations,
31 those around one thousand firms with market capitalizations of \$1 billion or more, receive half
32 the revenue of goods sold while the remaining around 5 million employer firms receive the other
33 half. Dunn perhaps could have gone the next step and shown that the dominant firms received
34 around \$323,000 in revenues per employee while the "market" firms only received around
35 \$141,000 in revenues per employee. Whether this difference is due to the social power of the
36 technostructure or simply economies of scale is another discussion and obviously not within the
37 realm of this book review.

Dunn is careful to call attention to the fact that endogenous money (a defining commonality amongst Post-Keynesian thought, described here mostly as increased bank lending and innovative financial instruments to ensure consumption financing, means that inflation is a *real* economy phenomenon (for Galbraith meaning the dominant sector utilizing their market power to keep prices high) as opposed to a Friedmanite *monetary* cause. This means for Galbraith that inflation is to be tamed by wage and price controls. In historical context Dunn uses the fact that JKG was the “Price Czar” (p. 34) during WWII to help describe the formulation of JKG’s views on price planning to control inflation (and in fact to help plan the economy using Keynesian macroeconomic tools). “Corporate power made comprehensive price control necessary in the Second World War but it also contributed to its success” (p. 321, from Galbraith 1975.) Dunn describes how JKG does not call for the commonly-accepted industrial organization economics break-up of monopolistic corporations, but rather for wage and price controls, finding large corporations, like Schumpeter, a source of economic dynamism.

Finally, this reviewer enjoyed most the chapter on JKG’s methodology, where we learn that his method is not one of “imitative scientism”, but “like Hayek, Keynes, Kaldor, Marshall, Marx, Menger, Robinson, Schumpeter and Veblen” (p. 77) Galbraith was an ontological realist, where the analyst’s moral predispositions influence analysis. JKG was a social reformer, a man with a public purpose. For this reviewer then we can match-up his vision and some of the missing analysis of his critique of corporations. JKG was a believer in macroeconomic policy-making and a progressive income tax to create a more stable and equitable society. Perhaps this moral foundation prevented him from seeing one reason why there is absentee ownership of corporations. The federal income tax allows the write-off of corporate debt interest payments pre-tax. This of course creates incentives for debt-based capitalization over equity for those who

1
2
3 are in the management class. JKG's "technostructure" gains its social power as debt to equity
4 ratios increase and shareholders lose their incentive to monitor in detail their investments. This
5
6 too might explain the huge and increasing pay differentials between the CEO and the person on
7
8 the factory floor as described in the "A man for our times" chapter. In this regard it would have
9
10 been nice to see some comparisons with other heterodox ideas for the corporatization and
11
12 financialization of the economy in this otherwise engaging monograph.

Dunn writes,

So while the grand sweep of Galbraith's analysis is often caricatured as conveying a
world of durable, dominant American megacorporations surreptitiously manipulating
gullible consumers, one should resist using this as an excuse for dismissing Galbraith's
economic contributions without further and deeper considerations (p. 11).

Our author succeeded in doing just this and this book can be recommended to anyone interested
in the intersection between economic thought and social engagement. Also of note that Dunn
includes a bibliography of more than 350 "additional" works written by JKG (alone and with
others) both in the popular and scholarly press. It is no wonder that John Kenneth Galbraith
remains, even today, one of the United States' most well-known economists, even if, as Dunn
proposes, under-appreciated by economists themselves.
